

## Best Practices

This page is currently under development. Please check back soon for more information. If you have any questions on this service, please call us at 828-254-4464 and ask for a service representative.

Technology is not the same as it was a few years ago. Businesses have increased their dependence on their computers and networks. Risks and threats to their infrastructure has increased as well. The preventative methods and standard practices that were used a few years ago may not be providing the full protection that a business needs today. TSAChoice is always pushing and striving to provide the best services and the right products for our clients. With today's technology, we recognize that our services have to be pro-active and complete. That is why we are moving beyond standard practices and delivering BEST PRACTICES. Many small businesses do not have dedicated Information Technology or IT staff to handle the new challenges that are evident today, and some businesses even though they are very dependent on their IT infrastructure, do not budget for maintenances and upgrades. This is where we are able to help. Our services are not just the break/fix reactive service, but we provide the pro-active consultative services that your business needs. In this article we are going to be talking about issues that businesses face in the following areas; Backup and Disaster Recovery, Network Security, Monitoring, Maintenance, and Management. These three areas are intertwined with each other, that if one area is lacking, than your entire IT infrastructure is increasingly at risk of a failure in some area that may cause costly downtime. We want to prevent that from happening to you.

IT Management Network Security Backup and Disaster Recovery
